

## **Chapter-3**

### **The origin of Human**

The origin of Man was not the simple way of an evolutionary progress that books once depicted that our chimp like ancestors gradually standing upright as their brains expanded and they became social & civilized. The main currents of the mythology describe it like a supernatural event that the starting pair of a man and a woman appeared asexually on the earth from an unknown and unspecified surrounding celestial body to sexually reproduce human populations. First, let us analyze how and when man appeared on the earth.

Do we evolve from the existed lower species as evolutionists claim? Or do we asexually appear on the earth directly in our present shape & form from the space as a supernatural event like mythologists claim? Or are we asexually originated by the God like Holy Scriptures suggest? Or do we come from a single ancestor at Africa from where we spread throughout the globe and grow into four races like the genetics & linguistics claim? Although each race has different body structure, color, make up, civilization and culture but they all have similar genetic composition.

Thus we find that there are several contradictory & isolated myths, ideas, views and theories to incompletely explain asexual appearance of a starting pair of humans on the earth; but none is able to completely and scientifically explain asexual origin of a starting human pair to sexually reproduce human population. Let us analyze & investigate some important ancient currents about the human appearance on the earth.

According to Vedic concept the starting man was Manu and the starting woman was Shatarupa. This starting human pair is born asexually by the body of Brahma in Styaloka (an unspecified & imaginary mythological celestial body in surround space of the earth). Thereafter this starting human pair is transported from the Styaloka to the earth to sexually reproduce human population. The Bhagawatam Gita explains that a starting human pair came from the higher planetary systems to appear on earth many hundreds of thousands of years ago. It is described in the Quran that Adam was exiled from the heaven and fell on the earth with a woman (Eve or Havva) to make starting human pair to sexually reproduce humanity. According to the Bible and Quran Eve is the mother of humanity. We can find similar concepts explaining the asexual origin & appearance of a starting human pair in the similar ways in other mythological stories.

As such we find a starting pair of a man & a woman that was produced asexually from the body of Brahma in the Indian mythology; similarly Adam & Eve were originated asexually as a starting human pair to sexually reproduce human population as described in the bible and the Quran. Although all the main ancient currents of the world believe that a starting pair for each of animal species was asexually created by an unknown mechanism, but they do not propose any viable framework of explanations for such asexual creation of numerous starting animal pairs to sexually reproduce numerous animal species.

Although such descriptions in Holy Scriptures have no scientific basis but they are certainly able to prepare a background for a long lasting quest in human mind to understand nature and life in their virtual perspectives. In fact such mythological stories

trigger modern human brain to investigate the asexual origin of the starting human pair on the earth. Let us see, what is the opinion of the modern scientists on this matter?

**Modern Approach:-**

Darwin rejected all the ancient beliefs, assumptions and mythological theories regarding origin of life to establish a well defined natural mechanism for the gradual evolution of different higher forms from bacteria like simple ancestral forms of life. Darwinian investigation and observation of nature demolishes all main ancient currents and puts forth a theory of natural selection for the origin of the specie.

He put forth strong arguments that each species comes from previously existing species by gradual accumulation of differences and modifications that trigger new characteristics in a specie. Such new characteristics pass on to next generations to make an entirely new species. Thus each species is converting into higher species in the struggle of life. This theory claims that human is also evolved from the bacteria like single cellular species through the gradual changes and modifications. No direct fossil evidences and practical experiments have found to support & substantiate such gradual changes and modifications to evolve a simple organism into a higher species.

Although the Darwinian Theory of evolution is rejected by the scientists but it is still able to enable the human mind to see, investigate and observe some thing beyond the main mythological currents in this regard. The Genetic strongly supports and substantiates the origin & evolution of an ancestral genetic pool to make & issue all the starting genes for all the species individually rather than the evolution of the species as Darwin claims. Although the Genetic could not propose any natural mechanism and explanation that how such an ancestral genetic pool should originated and evolved to originate and issue asexually individual starting genes for the species, it is able to turn human brain and mind to investigate the asexual origin and evolution of an ancestral genetic pool to asexually make and issue individual starting genes in entirely fresh way.

The story of modern science about the evolution of human is largely about how animals adapt to their environment by survival struggle. They have developed it on the basis of Darwinian suggestions. It suggests that the earliest primate appeared as a small insect eating animal like shrew around 55 MYA. In early Cenozoic period a group of tree climbing squirrel like animals appeared in Africa. They were followed by tarsier and lemur like primates, which spread into Africa and Asia along with two groups of higher primates-the new world monkeys and apes. It was the great apes of Africa that evolved into gorillas, chimpanzees and humans according to evolutionists. The fossils do not support such evolution of specie.

Molecular genetic specialists have now convincingly and firmly shown that all modern existing groups and branches of human species arose from one woman around 247000 years ago. They have called her the mitochondrial Eve that lived in Africa. According to a study led by Dr. Allan C. Wilson of the University of California, there are irrefutable genetic evidences that the entire human species arose from a single female in North Africa between 140000 and 280000 years ago. In other words it is conceivable that we all started from the womb of a single woman. But they do not explain that how the said Eve and her male partner were asexually originated on the earth to sexually establish human species?

It seems that the scientists are not able to propose a perfect natural mechanism & viable framework for the asexual creation of a starting human pair. As such scientists

have to accept Darwinian suggestions till they succeed in developing a perfect viable mechanism for the asexual appearance of a starting human pair on the earth.

**Proposed appearance of a starting human pair to make a single human species 'Homo Sapiens':-**

Based on the Asamanya vishwa model dependent realities, we establish firmly that the Mahakaushik-B as an ancestral genetic pool synthesized & issued all the starting genes in the form of numerous paired fertile cells. The last paired fertile cell is able to grow into a starting adult human pair to sexually reproduce Human species 'Homo Sapiens'. Before the starting pair of two fertile cells for human, the Mahakaushik body similarly produced so many human like shaped specie as complete specie; they have not any physical relation with humans. We can not consider them as pre human species because they could not perform any intellectual work that shows brain's high functions. Without the high functions of the brain no species is comparable with the Human. Therefore other than Homo sapiens, no animal species can be considered as Human species in respect of the DNA, mind and brain.

The Human is the sole species and it has no physical resemblances to any lower species. Because the Human does not evolve from any lower species; the starting genes of Humans come in existence directly in a paired fertile cell. Genetics supports firmly single human species and its direct origin from an ancestral genetic pool. Hence we can make a concrete conclusion that the starting genes for humans is originated & issued asexually in the form of a paired fertile cell by a single ancestral genetic pool containing biological body 'Mahakaushik body'. Thus a single ancestral biological body evolves to asexually make individual starting genes for each of organism including virus to human.

Fossil records indicate human like shapes & common physical features in a few species before the Human. Due to the common physical appearance scientists may be confused about the last few species. They count a few last species as pro-human species. In fact each animal-species on the earth is unique & complete; no animal species can evolve from any lower species according to our new model. Thus human is a unique species in respect of origin, brain, mind, body and DNA composition.

The study of mutation pattern in people globally produces a family tree of the human like species. At its base is Mitochondria Eve, about 1, 50,000 years ago. She was not the first of Homo sapiens but was the most recent common ancestor according to them. By studying mutation pattern it was found by scientists that Nuclear Adman was the most recent known common ancestor of all the humans. He lived between 90,000 to 60,000 years ago.

Such studies substantiate Asamanya vishwa model that Mitochondria Eve and Nuclear Adman should be a starting pair of human. Although such a starting pair of humans had no biological father and mother, but it had a single ancestor Mahakaushik body that produced it asexually in the form of a paired fertile cell according to our new model. Thus we can say firmly that a paired fertile cell begins to grow inside the Mahakaushik body and is released outside as a paired embryonic baby that grows independently in the nature into an adult human pair to reproduce human population sexually.

Genetic bottleneck, a study, firmly shows that humans have very little genetic diversity. One suggested reason for this is that Homo sapiens recently passed through a series of genetic bottleneck. It occurs when a population falls to dangerously low levels

causing gene pool to shrink. If the population expands again all descendants carry copies of the same limited set of genes. This theory suggests that only two sets of human genes are responsible for the whole human population. Such a study again supports & substantiates an asexual origin and development of a single starting Human pair to sexually reproduce human population as Asamanya vishwa model proposes.

#### **The Preperation of Paired fertile cell for human:-**

Based on fossils records we approximate that Mahakaushik-B began to produce supplementary PHCs for a group of early primates around 50 MYA and human like shaped higher primate species during short warmer interglacial period around 6-8 MYA. Thereafter Mahakaushik body produced chimpanzee, who flourished 5-7 MYA in Africa. Conditions on land made the Mahakaushik-B to go back in oceanic water around 5 million year ago. In the oceanic water it began to evolve some modifications in the body in floating conditions by producing a group of new genetic instructions in the form of PHCs that make some aquatic mammal's species and finally it comes on the continental land mass.

On the land masses Mahakaushik body allows almost all existed early PHC to fuse with supplementary PHC into paired fertile cells. Now Mahakaushik body has very few PHCs in its body. This is why Mahakaushik body reorganizes intelligently master DNA to produce highly capable supplementary PHC to face the recurrent earthly environmental conditions at last. When the last supplementary PHC fuses with early PHC, a pair of two fertile cells for starting human genes is synthesized. This pair of two starting fertile cells for human consume all the remaining PHC as food to grow into a pair of two embryos one female and one male. This asexually originated paired embryo grows into a pair of adult human around 2,000,00 years ago to sexually reproduce a human species.

The above cited studies (fossil analysis, mutation and the genetic bottle neck etc) successfully substantiate our new model for the asexual origin and appearance of starting human pair from an ancestral genetic pool to sexually reproduce single human species on the earth.

#### **The Human culture and religions:-**

The cultural revolutions starting with settled societies suggest that there was someone present in initial human society who taught them about culture & religion as code of conduct of life. The paired adult human with the brain and mind was able to evolve & teach the laws for societies to form social groups with the help of Mahakaushik thought waves. The starting paired adult human produced four male human only; modern females are produced in next generation as we discussed it in previous chapter. Thus these starting four male produced four human race in due course of time. Thereafter the following human populations establish family, community and finally villages to make & teach social norms to the following generation to carry and hold social laws in the form of culture and religion.

#### **The Human migrations:-**

The interpretation of fossil evidences indicates that the migration of human began in Africa 1, 20,000 years ago. This migration provides evidence that starting single human pair appeared at Africa. We can approximate that this starting adult pair of human should produce only four male human; they reproduce four human races ultimately.

When they have had some population, they migrate from there to settle in other parts of the world.

Based on Asamanya vishwa model we can interpret that before migration humans became social and cultured so that they could migrate in groups. They settled at new places with their ability to build a shelter and make social groups for community living to ensure their survival from the onslaught of ferocious wild life and inclement climatic conditions. Based on this human migration we can calculate that paired humans were produced by Mahakaushik body in Africa. From Africa they began their above mentioned migrations with a sizeable population around 1, 20,000 years ago.

They moved north out of the continent as early as 1, 00,000 years ago with a sizeable population. During this migration the humans had to fight with some of grouped species that assemble human like posture and skeleton. Scientists count them as pro-Human species that came into existence as a separate species much before the Homo sapiens. Modern scientists also believe that such Pro-Human species give rise to Homo sapiens. But in fact no species can convert into any higher species and each species comes into existence in its present form & shape from the starting paired fertile cells.

#### **Bipedal Movement and Standing Posture:-**

The upright posture is a fundamental human attribute. A long spine keeps us standing upright. No other mammal can match the ability to stand, walk, run and move on two feet. Although many other animals have the ability of bipedal motion, humans have the unique sense of balance on two feet enabling him to learn how to perform other complicated movements like dance. The master cell incorporates and reorganizes such physical features & skeleton at genetic level in response to recurrent climatic conditions to reorganize intelligently & uniquely in last two PHCs to make starting genes to make a starting paired fertile cell for the Human species.

#### **The Sense:-**

Humans have five main sense organs for the senses-vision, hearing, touch, smell and taste. According to our new understanding sense organ means a set of specific cells that are able to receive environmental signals through the radio pulses. The G-protein coupled receptors located at the cell membrane are able to amplify & transmit radio pulses into nucleus where they act on DNA to make resonance and resultant electric impulses. Thus radio pulses carry the environmental signals with them into the nucleus of a cell. The environmental signals are equally carried by coupled radio pulses to all the cells of a body, but the cells in the sense organs only are able to receive & amplify them to transfer into nucleus to sense the environment. Although the mechanism of sense organs and senses are explained as an inbuilt mechanism of DNA by biologists the Asamanya vishwa model proposes a different biological mechanism for the sense organs and senses based on radio pulsed driven mechanism.

As such environmental disturbances, smells, odors, heat, cold and nearby surroundings around the body affect the transmission mode of coupled radio pulses in so many patterns. Affected amplified radio pulses carry the signals for the environmental changes to the cells to make cellular response. This is the way by which the outside stimulations are carried by the said coupled radio pulses to the membrane of a receptor cell to amplify & transfer them into nucleus.

The Mahakaushik-B evolved highly well functioning sense and sense organs to manage and control its biological activities during its millions of year's long life span.

The Mahakaushik's sense organs are made of PHCs they contain G protein coupled receptors located on membrane of PHCs. The master genes for the sense are reorganized astonishingly in the PHC for the human. Let us try to learn about significant Human senses with our new understanding reflected in Asamanya vishwa model as under.

#### **Vision:-**

According to our new model constant interactions with the surroundings create a need in Mahakasuhik body's super brain to see & observe things from a large distance without physical contact to plan biological actions to face them. This need evolved vision in various varieties from 2D vision to 3D vision in Mahakaushik-B by producing specific receptor PHCs to form functional bio-structures for vision as eyes. The Mahakaushik-B evolves 3-D vision for manipulating things by hands, using fingers and other objects as a tool when it came out of the ocean and settled on land. The use of objects by the hands as a tool is only possible with 3-D vision. The master genes for the vision & eyes are reorganized intelligently in the PHCs for starting pair of human to make biological mechanism of eyes to have a perfect vision.

#### **Hearing and Balancing:-**

Modern biology enables us to know that the sense of hearing responds to earth's gravity and the atmospheric activities. According to Asamanya vishwa model the said coupled radio pulses carry minor changes in the air to the cells walls of specific receptor cells in the ears. In the ears the specific receptor cells are present to receive, amplify & convert coupled radio pulses into sound signals to transmit to the brain for interpretation to make sense hearing and ensure about body orientations in space. The master genetic instructions for hearing and balancing are reorganized uniquely & astonishingly for human PHC to make hearing organ with sensing mechanism for hearing and balancing.

#### **Touch:-**

Touch is a sense that gives us the ability to perceive the size, shape, texture and changes in temperature of things around. It also lets us experience and feel pain and pressure. The sense of touch is located in the skin and comes from a variety of nerve bunches that send nerve impulses to the brain. According to our new understanding, like the other senses are functional the sense touch is functional similarly through the said coupled radio pulses.

The skin of the Mahakaushik body contains receptors PHCs that are able to make signals from the changes in temperatures, pressures and attached things with the help of radio pulses. As a result the membrane of PHCs makes & sends electrochemical impulses to the super brain for interpretation. Then the super brain is able to generate resultant electrochemical impulses for the targeted PHCs to perform biological response. The master DNA rearranges and reorganizes itself to prepare genes for the wonderful sense of touch in the PHCs for paired humans. Thereafter the genes for touch pass on to the following human generations from the starting human pair.

#### **Taste and Smell:-**

The mechanism of taste and smell are similar. All odors and tastes are compiled in the brain by assimilating mouth and nose information. Let us try to learn that how such senses 'taste and smell' are evolved to carry them in animal species based on Asamanya vishwa model.

The Mahakaushik-B produces receptor PHCs to make organs to sense taste and smell to detect foods. The receptor PHCs in such organs are able to receive & convert

signals of taste and smell into an electrochemical signal to transfer to the super brain. Then super brain is able to make resultant electrochemical impulses for the targeted PHCs to respond the taste and smell. The master genes for taste and smell are reorganized intelligently & uniquely in human PHCs to carry genetically such a sensing mechanism in human species.

#### **Large human brain:-**

The human brain is 5 times as large as that of a chimpanzee. Scientists are not sure about the origin of such large brain of human. One notion is that the evolution of large brain was driven by the development of language; language may have changed the structure of human brain. A radical idea suggests that the large brain is merely a side effect of the evolutionary process that increases our life span; as the brain tissue cannot regenerate we need a large brain just to provide spare capacity that longer life demands.

Further, another idea suggests that large brain evolved to make us sexually attractive; Charles Darwin proposed his idea that sexual selection may have driven evolution of large brain. Another idea suggests that our large brain may be related to our carnivorous diet. A recent idea suggests that our large brain evolved for social reasons. As such, all aforesaid speculations cannot be the causes of size and functions of human brain. To know about the origin of human's large brain at genetic level we have to rely on the Asamanya vishwa model dependent framework again.

According to it the super brain evolves large size during the long evolutionary life span to direct & control its biological functions as we discussed it in previous chapter. The super brain has improved itself greatly in respect of size and complexity by long experience through learning new things and stores them as master memory. The fused PHCs leave behind neural circuits of neural PHC free. Free neural PHC make superfluous super brain that increases its size & it works beyond biological limits. Thereafter multiple facets are evolved from this superfluous super brain with help of master memory. Now superfluous super brain acts like a super mind.

As super brain is made of the neural PHCs, so master DNA contains the master genes for the super brain. The master genes for such an ever potent super brain reorganize intelligently in the last PHC for humans. Therefore, the physical brain of the human should mostly be a complete copy of the super brain in respect of its size and functions. Based on this new origin & mechanism of the biological brain and intelligence we are able to discuss independently about the different facets of large human brain & mind as under.

We know that the human mind incorporates high functions of the brain, including emotion, thinking, ideas, consciousness and language etc. No other species has such a mental skill to match the human mind. The brain is equipped with the biological information and it works according to the biological needs of the body. The non-biological high functions of mind indicate that human brain works beyond biological needs and it should be linked with an electromagnetic pool of information "Mahakaushik's thought waves".

We can calculate that the human mind should act as online computer to subconsciously communicate with Mahakaushik's thought waves. These Mahakaushik's thought waves are able to subconsciously enter the human brain to trigger, perform, guide and control high functions. Mahakaushik thought waves are trapped between the earth's

surface and ESR to communicate vital information to the human mind as we discussed it in previous chapter in detail.

The master genes to form human brain and mind were highly efficient at protein synthesis and energy production in the last two PHCs. With the help of such potent brain genes Mahakaushik body promotes capacity of the last two PHCs to produce all required proteins and energy to run its biological body for survival. Thus this tiny set of brain genes separates the human PHCs with previously formed PHCs at large. This is why human is uniquely most intelligent species with the largest brain.

The information regarding high functions should be generated & stored biologically in the super brain which releases it in our environment in the form of Mahakaushik's thought waves to guide human brain and mind in several ways. However some species have improved biological brain but they do not have any mind that could use Mahakaushik's thought waves for high functions.

Mahakaushik's super brain has electrochemical pulses or bio electromagnetic pulses to transmit outside to probe the surroundings. Such electromagnetic pulses reflect off the objects and reach again specific sense organs to communicate super brain about the surroundings up to deep space; it should be able to trace the whole universe in detail as modern instruments do. The super brain gets all information through its miracle sense organs and stores them in the form of master memory. When Mahakaushika dies the super brain converts its master memory into specific electrochemical pulses as Mahakaushik's thought waves to release into the environment to guide the all animal species for ever as we discussed it earlier in detail.

Some of the animal species show electromagnetic characteristics in their body to substantiate our new understanding about life. For example, some fishes are able to make an electromagnetic field around their body to probe the surroundings. The bats use ultrasound waves to find their way when they fly. Some birds have a special vision to see their prey from a very high sky and so on. Thus all bio sensing characteristics are originated in the Mahakaushik-B to pass on to species through the PHCs.

Hence, Mahakaushik body has especially potent sense organs with remote sensing properties to probe the whole visible and invisible surroundings in different wavelengths including all atmospheric layers, the different features of earth's crust, oceans, core and moon with planets, stars and galaxies etc. With the help of such miracle sense organs the Mahakasuhik body should be able to probe universe in multi wavelengths. Thereafter super brain should be able to store and convert all information into the electrochemical pulses and release it in the earth's environment where they are kept forever in the form of OSTCRW (M) and ISTCRW (M) to guide the animal kingdom in general and the human mind in specific ways.

Mahakaushik's thought waves should be able to activate the human mind to perform high functions for human welfare. The human mind only is able to receive the signals for miracle work through the Mahakaushik's thought waves. Hence the Mahakaushik thought waves are biologically evolved and electromagnetically or electrochemically established on the earth to guide, control & direct the entire DNA on the earth. Now we are able to discuss some of the significant facets of the human Mind as under.

One of the special facets of the human mind is its ability to work out what is going on in other peoples mind in order to predict their behavior. From this, we can infer

that the Mahakaushik's thought waves make such invisible function possible in the human mind by interlinking subconsciously both the interacting brains.

Language is another special facet of human mind. We can approximate that Mahakaushik's super brain has to develop billions of bio-electromagnetic languages to communicate, guide and control billions of animal species. Super brain makes & develops a master format in which all bio-electromagnetic languages can be classified to guide and control the brain & DNA of billions of animal species. This master format is electromagnetically released at the time of Mahakaushik's end as an electromagnetic data in the form of "Mahakaushik's thought waves".

Such a master format is able to enter in each of the human mind to enable it to learn, understand & develop different forms of language. Each human brain is equipped with this master format to develop & understand a personal language. Thus human mind has a potency to learn, understand and develop its own languages with the help of master format.

When we concentrate we seem to talk to ourselves with an inner voice. Certainly without our grasp of language we could never have been able to get to the bottom of some of the mind's mysteries. This is why it seems that all human languages are developed from a single language format from Africa where starting human pair was appeared. Thereafter language spreads out of Africa with the human migration.

Repeatable phenomena, like seasons, Sun's radiation during the whole day and whole year, fall and rise in temperature open up different ways of learning for Mahakaushik body. Every day a series of needs repeated and a sequence of actions had to be performed by Mahakaushik-B; this in turn produced master memory in the Mahakaushika brain; hence in the species. Repeating phenomena with minimum variations can be faced easily with memory of previous experiences of the similar events. This links memory with present and mind to use it to perform certain day to day functions and to perform higher functions of the mind.

The process by which people arrive at a new and useful idea is believed as the pinnacle of human thinking. Valuable creative ideas are found in all areas of life. It involves several stages-conscious thought, incubation, sudden inspirations and development and assessment of the idea. As such new ideas should come & enrich into human brain through the Mahakaushik thought waves.

**Death, Soul & Reincarnation:** In both the cases of deaths 'natural and unnatural death as discussed in previous chapter', the memory segments of human brain transfer into electrochemical pulse and released into environment to join with the said Mahakaushik's thought waves. The Mahakaushik's thought waves absorb & carry these individual human's electrochemical pulses that are released at the time of decomposition of a human brain.

These electrochemical pulses of an individual human brain with the Mahakaushik's thought waves are able to enter a growing human brain to provide it the memory segments of a dead person temporarily. This growing human should have almost identical body field and DNA so that the Mahakaushik's thought waves with the said memory segments of dead person are able to enter and affect said growing brain temporarily. The growing human brain can work with a memory segment of a dead human for a few hours to a few months only; because the human brain is naturally equipped to

work with the help of its own earned memory on a day to day experience through its own sense organs only.

The releasing of such individual human memory segment into environment in the form of electromagnetic pulses to join the Mahakaushika's thought waves can be termed as releasing of soul from the body. The activation of a memory segment of a dead human brain into a living human brain can be called re-incarnation; the belief that after some body's death his soul lives again in a new body.

Thus the soul can be treated as electrochemical energy form of a memory segment of a dead man. This memory is transformed into electrochemical energy before the decomposition of brain and released in the environment at the time of death to join the said Mahakaushik's thought waves.

Based on available information and above cited discussion about the human brain and its electromagnetic or electrochemical sensitivity we can have perfect approximations that the memory of a dead person can be transformed into an electromagnetic form to retain it out of biological brain and then it can be transferred electrochemically into a growing human brain which should have similar electrochemical properties. Such a process first of all requires conversion of memory of a person into electrochemical pulses, then their retention in the environment to transfer them into another growing human brain at a different time in future. The human brain can be temporarily governed by such electrochemically transferred memory of a dead person! This is why reincarnation is a temporary phenomenon.

In the reported cases of reincarnation, researchers found that a child's brain recalls some memory segment of a dead person. How does that happen? Our growing understanding tries to answer such questions in a different way on behalf of Asamanya vishwa model as reflected in above discussion. However such incidences have not been corroborated medically or scientifically to study. We hope that in future improved instruments will enable scientists to measure and identify different types of radio pulses, electromagnetic pulses and Mahakaushik's thought waves that rule the DNA and biological brain to understand such unusual biological phenomenon.

#### **Subconscious wisdom:**

Conscious thinking is a part of what goes on in our brain. It is what we are aware of at any one moment and is therefore extremely limited. Subconscious thinking is constantly going on behind our conscious thoughts and determines much of our behavior.

The subconscious wisdom is an astonishing segment of the human mind. It is also called MANA, VIVEKA, ATMA, ANTARATMA and BRAHMA in Hindu philosophy. It suggests to the human mind what is right or wrong. How is it possible that subconscious wisdom guides our behavior and life through indications? According to our new understanding the Mahakaushik's thought waves play the role of subconscious wisdom in the human mind. The Mahakaushik's thought waves have all the information about the all the human brains, DNA and nature to guide & direct human mind subconsciously. Subconscious processes in human brain are originated and regulated by Mahakaushik's thought waves to make & operate subconscious wisdom.

This is the way by which the Mahakaushik body is biologically evolved on the earth, lives for billions of year and stays here forever in the form of Mahakaushik's thought waves to direct & guide DNA & brain of all the species. It guides the human mind in specific way. We can call it God of life that governs life only.

### **Human extinction:-**

We call a star pair “Human-star pair” that makes the PHC for human in Mahakaushika’s body. The radio pulses from human-star pair are able to activate sex chromosomes to activate all the chromosomes in a human cell. Thereafter the DNA in the cell is able to work under the influence of numerous radio pulses from numerous star pairs. When the Human-star pair will set behind the massive galaxy the entire human DNA will be deactivated for ever making an extinction event for human species according to our new model. Without these radio pulses the sex chromosomes in the human cells are not able to be activated. As a result other chromosomes are not able to work without the active sex chromosomes. This at once inactivates entire human DNA on the earth to make an extinction event for the human.

This will happen in millions of years possibly when the said Human-star pair will hide behind a massive galaxy making a mass extinction event only for humans. Although other forms of life will flourish during such event, the human DNA will not be able to compose and run life without the coupled radio pulses from the Human-star pair. If the Human star pair is in such a position to shine for ever in respect of the earth due to its orbital position in the space, Humans will live on the earth for ever!

### **Longer life for humans:-**

Based on Asamanya Vishwa model dependent realities we can approximate that controlled discharging of the excess intercellular electricity should normalize the body field which allow radio pulses to transmit on the body’s cells properly to make them functional again with more potency. Advances in modern bio technologies should enable scientists to discover bio techniques and instruments to discharge excess intercellular electricity from the old humans to provide them healthy longer life.

As such discharged intercellular fluid should be able to make & hold a required body field with required strength. Such a field should be able to allow radio pulses to transmit on the body cells properly to regain DNA potency to work with full capacity. Thus controlled discharging of the excess intercellular electricity in the old humans should cure several ailments related to old age and provide a longer healthy life beyond normal life span. Such bio techniques should make & keep an immortal healthy human body with an unlimited longer life span.

Required corrections in body field by controlled electrochemical discharging or charging of intercellular fluids should treat DNA malfunctioning related diseases like cancer and aids and diabetes and so on.

\*\*\*\*\*
